Education

University of Lagos — Lagos, NG
B.Sc. in Computer Engineering, First Class Honours — *Aug 2026*

- CGPA: 4.52/5.00
- Relevant Coursework: Databases, Software Engineering, Distributed Systems, Computer Networks, Operating Systems, Cloud Computing

Experience

Software Developer — Apr. 2025 – Present
Today's Solution — *Lagos, NG*

- Built a loan management system in C# and ASP.NET Core on Premier, the company's ERP platform that universities use to run admissions, registration, results and fee payments, serving investor and loan client workflows
- Designed a wallet subsystem on a double-entry ledger so every debit has a matching credit and each transaction can be traced and audited end to end
- Modeled the relational data layer with Entity Framework and SQL Server and implemented role-based access control so staff and administrators only reach the records their role allows
- Designed the REST APIs behind a React portal for investors and loan clients and shipped an automated HTML email notification service for payment and account events
- Own production deployment on Windows Server and IIS and resolve live incidents by tracing logs, database state and configuration to the root cause

Co-founder and Backend Engineer
Lisah, Fintech Investment Platform | C#, .NET, Flutterwave, Quidax — *Lagos, NG*

- Sole backend engineer on a platform where users buy and trade stocks, convert between assets, and lock cash, stocks or crypto for a fixed period
- Integrated Flutterwave for payments and Quidax for identity verification and handled provider webhooks alongside user-initiated transactions
- Built wallet and transaction services with idempotency keys and state checks on webhook processing, so late or repeated provider callbacks are applied exactly once
- Enforced lock periods at the transaction layer so locked assets cannot be withdrawn or traded until maturity

Freelance Software Engineer (Contract) — 2026
Hotel PMS to Vestel TV Middleware | C++, TCP, HTTPS — *Lagos, NG*

- Built C++ middleware that bridges a hotel property management system's FIAS protocol over TCP and the HTTPS interface Vestel TVs understand, parsing guest events and translating each into the requests the TVs expect

Projects

Cachet: In-Memory Key-Value Store (Mini-Redis) | *Go, TCP, Concurrency*

- Built a concurrent key-value store in Go with a Redis-style protocol over raw TCP, sharded maps to cut lock contention and LRU eviction to bound memory
- Benchmarked with redis-benchmark at 77k+ SET ops/sec and 59k+ GET ops/sec across 50 concurrent clients with no correctness regressions under load

Technical Skills

Languages: C#, TypeScript, Node.js, SQL, C++, Go
Backend: ASP.NET Core, Entity Framework, NestJS, REST API Design, Authentication and Role-Based Access Control, Payment Integrations, Webhooks, Idempotency, Double-Entry Ledgers
Databases: SQL Server, PostgreSQL, MySQL, MongoDB
Tools: Git, Docker, Windows Server, IIS, Linux, CI/CD, Postman
