Education

University of Lagos — Lagos, NG
B.Sc. in Computer Engineering — *Class of 2026*

- CGPA: 4.52 / 5.00
- Relevant Coursework: Data Structures & Algorithms, Operating Systems, Distributed Systems, Computer Networks, Databases, Software Engineering, Cloud Computing

Experience

Software Developer — Apr. 2025 – Present
Today's Solution — *Lagos, NG*

- Built a production loan management system in C# and ASP.NET Core on top of the company's internal ERP framework, extending a platform originally built for university ERP deployments to support loan origination and investor/client workflows
- Designed a wallet subsystem backed by a double-entry bookkeeping ledger, enforcing balanced debits and credits so every investor and loan-client transaction is traceable and auditable end to end
- Modeled the relational data layer with Entity Framework and SQL Server, and implemented role-based access control so staff and administrators operate on records safely through the ERP back office
- Designed and exposed REST APIs powering a React portal for investors and loan clients, decoupling the customer-facing experience from core ERP operations
- Owned production deployment on Windows Server with IIS; debugged live incidents across application logs, database connections, and configuration, and shipped an automated HTML email-notification service

Projects

Cachet: In-Memory Key-Value Store (Mini-Redis) | *Go, TCP, Concurrency*

- Built a concurrent in-memory key-value store in Go speaking a Redis-style wire protocol over raw TCP, supporting GET / SET / DEL / EXPIRE with per-key TTL expiry
- Implemented thread-safe access using sharded maps to reduce lock contention, goroutine-per-connection handling, and an LRU eviction policy to bound memory under sustained write load
- Benchmarked with redis-benchmark at 77k+ SET ops/sec and 59k+ GET ops/sec across 50 concurrent clients with no correctness regressions under load

E-Commerce Backend Platform | *NestJS, TypeScript, PostgreSQL, REST APIs*

- Engineered a scalable e-commerce backend using a modular, service-based architecture for clean separation of concerns and long-term maintainability
- Developed REST APIs for product catalogue management, user authentication, order processing, and payment workflows
- Implemented layered validation and transactional data handling across services to preserve data integrity through concurrent order and payment operations

Decentralized Fish Supply Chain Platform | *Solidity, ASP.NET Core, Nethereum, IoT*

- Designed a blockchain-based traceability system letting farmers, processors, distributors, and retailers record shipment events on-chain for an auditable farm-to-market product trail
- Wrote Solidity smart contracts implementing role-based participant access and logistics state transitions
- Built an ASP.NET Core backend with Nethereum to invoke contracts and consume emitted on-chain events, ingesting IoT sensor readings to attach real-world environmental conditions to ledger records

Technical Skills

Languages: C++, Go, C#, TypeScript, JavaScript (ES6+), SQL, Solidity, HTML/CSS
Frameworks & Runtimes: ASP.NET Core, .NET, Node.js, NestJS, Express.js, Entity Framework, React
Databases: SQL Server, PostgreSQL, MySQL, MongoDB, Relational Database Design
Systems & Concepts: Data Structures & Algorithms, Concurrency, Distributed Systems, Networking (TCP/IP), System Design, REST API Design, Backend Architecture, Authentication
DevOps & Tools: Docker, Kubernetes (basics), CI/CD, Linux, Windows Server, IIS, Git, GitHub, Postman
